

# AUTOMATIC RECORD CHANGERS Part No. 35-1285, 35-1286, 35-1289

The service information in this bulletin covers the adjustments and replacement parts for Philco automatic record changers Part No. 35-1285 (standard changer) and Part No. 35-1286, 35-1289 (Deluxe changers).

These record changers are identical with the exception of the color of the mounting plate, plating of parts on top of changers, motor, Light Beam Reproducer, and electrical wiring circuits for operation. The differences are indicated in the Replacement Part List, page 4, and the Electrical wiring diagrams, page 5.

#### CHANGERS USED IN PHILCO MODELS

Changer Part No.			Philco Models			
	35-1285		42-1008,	42-1009,	42-1010,	
			42-1011,	42-1012,	42-1013	
	35-1286				42-1016	
	35-1289				42-1015	

#### GENERAL DESCRIPTION OF CHANGE CYCLE

An automatic record changer performs three principal functions.

- 1-Places record on turn table.
- 2—Lowers tone arm on record in playing position.
- 3—Raises tone arm at end of record or on reject.

These functions are controlled by three mechanisms, interconnected and built together, but each separate in its operation. The motion for each is orginated in one central cam gear which has three different and individual cam surfaces. The cam gear is normally at rest while a record is being played, but is put into operation by a saw tooth clutch which takes its power from the turntable and drives an intermediate drive gear. This only takes place when the record changer is put into a change cycle. The cam gear then makes one full revolution to complete the change cycle and comes to rest in a normal position.

The record changing mechanism which places a record on the turntable is brought into operation by a lever with a roller at one end. The lever is attached to the shelf plate mounting post and is operated by a notch under the cam gear. This causes the mounting post to move slightly, pushing the bottom record off the stack onto the turntable.

The pick-up operating mechanism is likewise brought into operation by the cam gear surface on the top side of the cam gear. The raising lever, when removing the pick-up from the record, receives a swinging motion from the cam gear through an eccentric track on the top outside surface of the cam gear. This eccentric track causes the pick-up to be carried out beyond the turntable while a record is being dropped on the turntable. The light beam pick-up is then brought back into playing position for 10" or 12" records (depending on the shelf positions on the shelf carrier.

The travel of the pick-up arm towards the turntable for lowering on a 10 or 12 inch record is stopped at the proper point for lowering by a movable track on the cam gear. This movable track is operated by a lever which is moved by a spring lever connected through a cord and spring attached to the 10" shelf plate. When the 10" shelf plate is lifted up the movable track is allowed to shift to the outer groove of the cam gear surface so that the pick-up needle will set properly on the outer edge of a 12" record. When the 10" shelf plate is in place for playing 10" records, the cord holds the spring lever and causes the movable track lever to shift to the inner groove as the cam gear revolves.

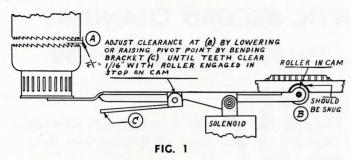

The electric reject trip causes the clutch to engage and allow the tone arm to be removed from the record by the cam gear. The reject trip operates through a pulsating plate and movable contact on the tone arm raising lever. When the pulsating plate and movable contact make connection, the solenoid is energized, releasing the clutch so that the cam gear can be revolved.

#### OILING

These record changers should be lubricated once a year with a few drops of good light machine oil at the following points: Motor bearings, drive disc bearings and cam gear bearing.

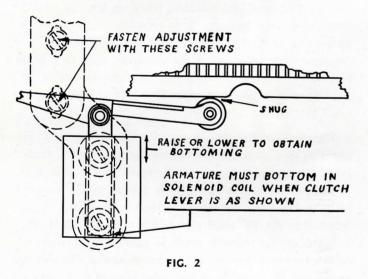

#### CLUTCH ROLLER AND LEVER ADJUSTMENT

The teeth of the clutch should have approximately 1/16 inch clearance, when the lever roller is engaged snuggly in the cam gear. If the clutch does not have 1/16 inch clearance the clutch bracket should be slightly bent as indicated in Figure 1. Place ten, 12" records on turntable when this adjustment is made.

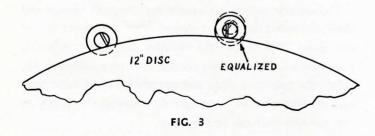

# SOLENOID ADJUSTMENT

The solenoid Armature should set properly in the coil in order to prevent hum and chatter when the solenoid is energized. To make this adjustment, loosen solenoid mounting bracket screws and raise or lower solenoid until armature is set correctly in the coil. See Figure 2.

#### BUMP LEVER ADJUSTMENT

Set 12" shelf eccentrics bumper in outer position, neutral (large part of cam away from shelf) and then equalize each Bumper to touch edge of 12" record. See Figure 3.

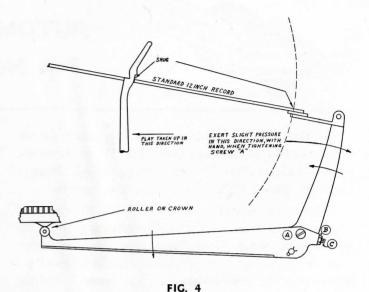

#### FORWARD SHELF MOTION ADJUSTMENT— MINIMUM SIZE

(12" Record Push-Off)

1. Place 12" record on spindle and 12" shelf as shown in Figure 4. Start changer in cycle and then stop the change cycle when the crown on the cam gear touches the roller on the shelf lever as shown in Figure 4.

2. In this position loosen screw "A" and lock nut on screw "C"; turn out screw "C" slightly and then retighten screw "C" until eccentric record bumpers fit snuggly against 12" record. Then tighten screw "A" and lock nut of screw "C."

# NEUTRAL SHELF POSITION

(Bump Lever Eccentric)

When the changer is in Neutral position (out of change cycle) the shelf lever should be in the position as shown in Figure 5. To make this adjustment, proceed as follows:

- 1. Place standard 12" record on the turntable spindle and 12" record shelf plate as shown in Figure 5. The roller of the shelf lever must be off the crown of the cam gear when this adjustment is being made.
- 2. Hold record snuggly against the spindle and shelf bumpers.
- 3. Loosen screw and adjust eccentric (A) Figure 5, until it touches shelf lever.

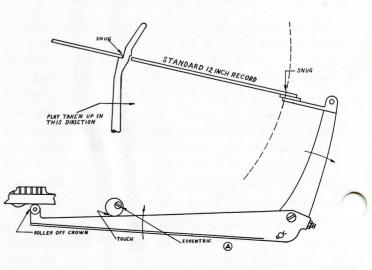

FIG. 5

#### 10" SHELF ECCENTRIC ADJUSTMENT

The 10" shelf bump buttons are equalized as follows:

Place standard 10" record on spindle and 10" record shelf. The record should be snug against spindle notch as shown in Figure 5 for 12" records.

Adjust 10" shelf bump buttons so that they are equalized and just touch record.

Do Not Change "Bump Lever Eccentric" shown in Figure 5 and which should be adjusted as given in paragraph "Neutral Shelf Position."

#### TONE ARM HEIGHT

- 1. Load the turntable with twelve 10" records.
- 2. Start changer through its cycle, then stop when tone arm is in full raised position and swinging towards records on turntable. If adjustment is correct, the jewel needle will clear the top record by ½" as the tone arm swings into position for landing on record. If it does not clear top record by ½", adjust screw No. 14 in top of tone arm (see Figure 9) until distance is obtained.

### ADJUSTING TONE ARM TO INDEX ON 10" AND 12" RECORDS

The position at which the pick-up jewel lowers on the edge of the record is controlled by a vernier adjustment screw on the raising lever. This screw is reached through the hole (12) Figure 9 in the top of the base plate near the tone arm pivot. This screw is used for normal adjustments of the tone arm set down and moves the pick-up approximately ½". Adjust the screw so that the tone arm needle will set down approximately ½" in on record edge. When set for either size record, the adjustment will also take care of the other size record positioning point.

When the tone arm is removed for replacement or greater movement of the tone arm is desired, beyond that obtainable with the preceding vernier adjustment, the two set screws in the collar of the pull-in lever underneath the changer should be adjusted. This is done by loosening one set screw and tightening the other, depending on which way the tone arm is to be moved. Under ordinary circumstances this adjustment will not be required as it has been preset at the factory for proper positioning. When making this adjustment, a .005 shim gauge should be placed between the ball race washer and the tone shaft bearing.

#### PULSATING PLATE ADJUSTMENT

When the turntable is revolving the pulsating plate of the reject mechanism should clear the main plate by 1/32 of inch when the crown on the cam attached to the underside of the turntable touches the pulsating lever roller at its highest point. See Figure 6. To make this adjustment proceed as follows:

- Rotate turntable until the crown of the cam under turntable touches roller of pulsating lever as shown in Figure 6.
- 2. Adjust screw on pulsating lever until pulsating plate is 1/32 of an inch from main plate (use gauge).

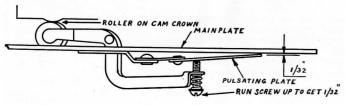

FIG. 6

#### TRIP ARM ADJUSTMENT

- 1. Rotate turntable so that the crown on the cam under the turntable is OFF roller of pulsating lever. (See Figure 7.)
- 2. Move tone arm in towards record until the rubber roller and contact is at the outer edge of pulsating plate. See Figure 7.
- 3. Turn screw (A) Figure 7 on trip arm until rubber roller just touches pulsating plate, then turn screw (A) slightly further so that the plate moves slightly.

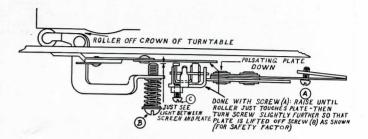

FIG. 7

#### REJECT CONTACT TRAVEL ADJUSTMENT

Place a record on turntable and tone arm in playing position about halfway in on playing lines of the record. In this position the contact operated by the rubber roller on the trip arm should be carried to within 1/16 to 3/32 of an inch of the pulsating plate as the roller moves towards center of changer. (See Figure 8). If contact does not have this spacing as the roller moves and pulls contact up, then adjust screw (C) Figure 8 until correct spacing is obtained.

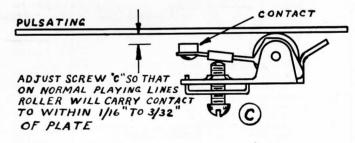

FIG. 8

## TURNTABLE SPEED ADJUSTMENT

To set the turntable speed control for the speed range covered by the control, proceed as follows:

- Push speed lever knob to the "normal" position. Turn ball knob until the motor mounting plate drops to its lowest position. In this position the turntable should be turning at approximately 77 R.P.M. This is indicated by the lines on the edge of the turntable appearing to be slightly moving backwards (counter-clockwise). In order to see these lines move the neon lamp must be energized.
- 2. If the lines do not travel slightly backward, the nuts on the motor mounting plate retaining shaft should be loosened and the plate moved up or down to get the proper speed, then tighten nuts.
- 3. After this adjustment, set ball knob to the point where lines on turntable appear to be standing still.

# REPLACEMENT PARTS AUTOMATIC RECORD CHANGER PART NUMBERS 35-1285, 35-1286, 35-1289
